Project Overview

This project analyzes state-level SNAP prediction data to explore geographic patterns in projected food assistance demand across the United States.

Using Python for data processing and QGIS for spatial visualization, the analysis examines three key indicators used in SNAP eligibility calculations.

Variables Analyzed

- **Predicted SNAP Participants**
  Estimated number of individuals expected to receive SNAP benefits in each state based on modeled economic conditions.
- **Reported Shelter Deductions**
  Total housing-related deductions (rent, mortgage, and utilities) reported by SNAP households. Higher values indicate a greater share of income being spent on housing.
- **Excess Shelter Deductions**
  Additional deductions applied when housing costs exceed 50% of a household's adjusted income. Higher values can indicate increased financial strain from housing costs.
